

How to compare two columns in Excel for matches and differences

Aug

26

by Svetlana Cheusheva  Excel, Excel duplicates, Excel functions, Excel tips  204 Comments

Comparing columns in Excel is something that we all do once in a while. Microsoft Excel offers a number of options to compare and match data, but most of them focus on searching in one column. In this tutorial, we will explore several techniques to **compare two columns** in Excel and find matches and differences between them.

- ▶ [Comparing two columns in Excel row-by-row](#)
- ▶ [Comparing multiple columns for row matches](#)
- ▶ [Compare two columns for matches and differences](#)
- ▶ [Compare two lists and pull matching data](#)
- ▶ [Highlight matches and differences between 2 columns](#)
- ▶ [Highlight row matches and differences](#)
- ▶ [How to compare two cells in Excel](#)
- ▶ [Formula-free way to compare two columns or lists in Excel](#)

How to compare 2 columns in Excel row-by-row

When you do data analysis in Excel, one of the most frequent tasks is comparing data in each individual row. This task can be done by using the [IF function](#), as demonstrated in the following examples.

Example 1. Compare two columns for matches or differences in the same row

To compare two columns in Excel row-by-row, write a usual IF formula that compares the **first two cells**. Enter the formula in some other column in the same row, and then copy it down to other cells by

C2

:

=IF(A2=B2, "Match", "")

	A	B	C	D	E
1	Column1	Column2	Match/No match		
2	sweets	sweets	Match		
3	grapes	apples			
4	lemons	lemons			
5	sweets	apples			
6	apples	grapes			
7	lemons	sweets			
8	sweets	apples			

Drag down to copy the formula to other cells

Formula for matches

To find cells within the same row having the same content, A2 and B2 in this example, the formula is as follows:

```
=IF(A2=B2, "Match", " ")
```

Formula for differences

To find cells in the same row with different content, simply replace "=" with the non-equality sign:

```
=IF(A2<>B2, "No match", " ")
```

Matches and differences

And of course, nothing prevents you from finding both matches and differences with a single formula:

```
=IF(A2=B2, "Match", "No match")
```

Or

```
=IF(A2<>B2, "No match", "Match")
```

The result may look similar to this:

C2

:

=IF(A2=B2, "Match", "No match")

	A	B	C
1	Column1	Column2	Match/No match
2	1	1	Match
3	-3	-1	No match
4	01/01/2015	01/01/2015	Match
5	02/01/2015	02/03/2015	No match
6	14:30	14:30	Match
7	3:15 PM	6:15 PM	No match
8	sweets	sweets	Match
9	apples	grapes	No match
10	lemons	LEMONS	Match

As you see, the formula handles **numbers**, **dates**, **times** and **text strings** equally well.

Example 2. Compare two lists for case-sensitive matches in the same row

As you have probably noticed, the formulas from the previous example ignore case when comparing text values, as in row 10 in the screenshot above. If you want to find **case-sensitive matches** between 2 columns in each row, then use the EXACT function:

```
=IF(EXACT(A2, B2), "Match", "")
```

	A	B	C
1	Column1	Column2	Case-sensitive match
2	sweets	sweets	Match
3	apples	grapes	
4	lemons	LEMONS	
5	Lemons	Lemons	Match
6	GRAPES	Grapes	

To find **case-sensitive differences** in the same row, enter the corresponding text ("Unique" in this example) in the 3rd argument of the IF function, e.g.:

```
=IF(EXACT(A2, B2), "Match", "Unique")
```

Compare multiple columns for matches in the same row

In your Excel worksheets, multiple columns can be compared based on the following criteria:

- Find rows with the same values in **all columns** ([Example 1](#))
- Find rows with the same values in **any 2 columns** ([Example 2](#))

Example 1. Find matches in all cells within the same row

If your table has three or more columns and you want to find rows that have the same values in all cells, an IF formula with an AND statement will work a treat:

```
=IF(AND(A2=B2, A2=C2), "Full match", "")
```

D2 : =IF(AND(A2=B2, A2=C2), "Full match", "")

	A	B	C	D
1	List 1	List 2	List 3	Match/No match
2	1	1	1	Full match
3	-3	-1	-3	
4	01/01/2015	01/01/2015	01/01/2015	Full match
5	02/01/2015	02/01/2015	02/03/2015	
6	14:30	14:30	14:30	Full match
7	3:15 PM	6:15 PM	6:15 PM	
8	sweets	sweets	sweets	Full match
9	apples	grapes	grapes	
10	lemons	LEMONS	Lemons	Full match

If your table has a lot of columns, a more elegant solution would be using the [COUNTIF function](#):

```
=IF(COUNTIF($A2:$E2, $A2)=5, "Full match", "")
```

Where 5 is the number of columns you are comparing.

Example 2. Find matches in any two cells in the same row

If you are looking for a way to compare columns for **any two or more cells** with the same values within the same row, use an IF formula with an OR statement:

```
=IF(OR(A2=B2, B2=C2, A2=C2), "Match", "")
```

D2 : =IF(OR(A2=B2, B2=C2, A2=C2), "Match", "")

	A	B	C	D
1	Column1	Column2	Column3	Match/No match
2	1	2	3	
3	-3	-1	-3	Match
4	01/01/2015	01/03/2015	01/02/2015	
5	02/01/2015	02/02/2015	02/02/2015	Match
6	sweets	pies	sweets	Match
7	apples	grapes	oranges	
8	apples	LEMONS	Lemons	Match

In case there are many columns to compare, your OR statement may grow too big in size. In this case, a better solution would be adding up several COUNTIF functions. The first COUNTIF counts how many columns have the same value as in the 1st column, the second COUNTIF counts how many of the remaining columns are equal to the 2nd column, and so on. If the count is 0, the formula returns "Unique", "Match" otherwise. For example:

```
=IF(COUNTIF(B2:D2, A2)+COUNTIF(C2:D2, B2)+(C2=D2)=0, "Unique", "Match")
```

=IF(COUNTIF(B2:D2,A2)+COUNTIF(C2:D2,B2)+(C2=D2)=0,"Unique","Match")

	A	B	C	D	E
1	Column1	Column2	Column3	Column4	Match/Unique
2	1	2	3	4	Unique
3	-3	-1	-3	-4	Match
4	01/01/2015	01/01/2015	01/02/2015	01/03/2015	Match
5	02/01/2015	02/02/2015	02/03/2015	02/04/2015	Unique
6	sweets	pies	cakes	pies	Match
7	apples	grapes	oranges	cherries	Unique
8	apples	LEMONS	Lemons	grapes	Match

How to compare two columns in Excel for matches and differences

Suppose you have 2 lists of data in Excel, and you want to find all values (numbers, dates or text strings) which are in column A but not in column B.

For this, you can embed the COUNTIF(\$B:\$B, \$A2)=0 function in IF's logical test and check if it returns zero (no match is found) or any other number (at least 1 match is found).

For instance, the following IF/COUNTIF formula searches across the entire column B for the value in cell A2. If no match is found, the formula returns "No match in B", an empty string otherwise:

=IF(COUNTIF(\$B:\$B, \$A2)=0, "No match in B", "")

=IF(COUNTIF(\$B:\$B, \$A2)=0, "No match in B", "")

	A	B	C
1	Column1	Column2	Matches in column B
2	1	2	
3	-3	-1	No match in B
4	4	1	No match in B
5	02/01/2015	02/03/2015	
6	02/10/2015	02/01/2015	No match in B
7	sweets	LEMONS	
8	apples	sweets	No match in B
9	lemons		

 **Tip.** If your table has a fixed number of rows, you can specify a certain range (e.g. \$B2:\$B10) rather than the entire column (\$B:\$B) for the formula to work faster on large data sets.

The same result can be achieved by using an IF formula with the embedded ISERROR and MATCH functions:

```
=IF( ISERROR( MATCH( $A2, $B$2:$B$10, 0 ) ), "No match in B", "" )
```

Or, by using the following array formula (remember to press **Ctrl + Shift + Enter** to enter it correctly):

```
=IF( SUM( -- ( $B$2:$B$10=$A2 ) )=0, " No match in B", "" )
```

If you want a single formula to identify both matches (duplicates) and differences (unique values), put some text for matches in the empty double quotes ("") in any of the above formulas. For example:

```
=IF( COUNTIF( $B:$B, $A2 )=0, "No match in B", "Match in B" )
```

How to compare two lists in Excel and pull matching data

Sometimes you may need not only match two columns in two different tables, but also pull matching entries from the second table. Microsoft Excel provides a special function for such purposes - the [VLOOKUP function](#). As an alternative, you can use more powerful and versatile INDEX & MATCH formulas.

For example, the following formula compares the product names in columns D and A and if a match is found, a corresponding sales figure is pulled from column B. If no match is found, the #N/A error is returned.

```
=INDEX( $B$2:$B$6, MATCH( $D2, $A$2:$A$6, 0 ) )
```

E2

:

=INDEX(\$B\$2:\$B\$6,MATCH(\$D2,\$A\$2:\$A\$6,0))

	A	B	C	D	E
1	Product	Sales		Product	Sales
2	Apples	\$100		Bananas	\$150
3	Cherries	\$200		Grapes	\$90
4	Bananas	\$150		Lemons	\$300
5	Lemons	\$300		Mango	#N/A
6	Grapes	\$90		Cherries	\$200

For the detailed explanation of the formula's syntax and more formula examples, please check out the following tutorial: [INDEX & MATCH in Excel - a better alternative to VLOOKUP](#).

If you don't feel very comfortable with this formula, then you may want to try the [Merge Tables wizard](#) - a fast and intuitive solution that can compare and match 2 tables by any column(s).

Compare two lists and highlight matches and differences

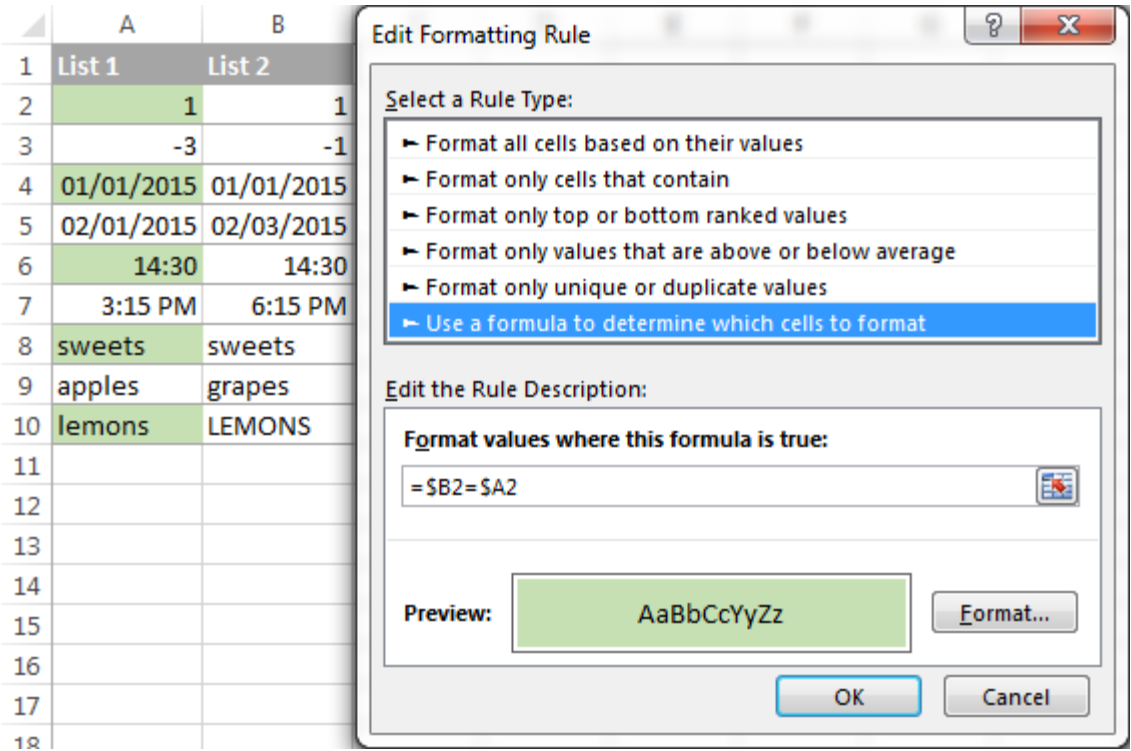

When you compare columns in Excel, you may want to "visualize" the items that are present in one

column but missing in the other. You can shade such cells in any color of your choosing by using the [Excel Conditional Formatting](#) feature and the following examples demonstrate the detailed steps.

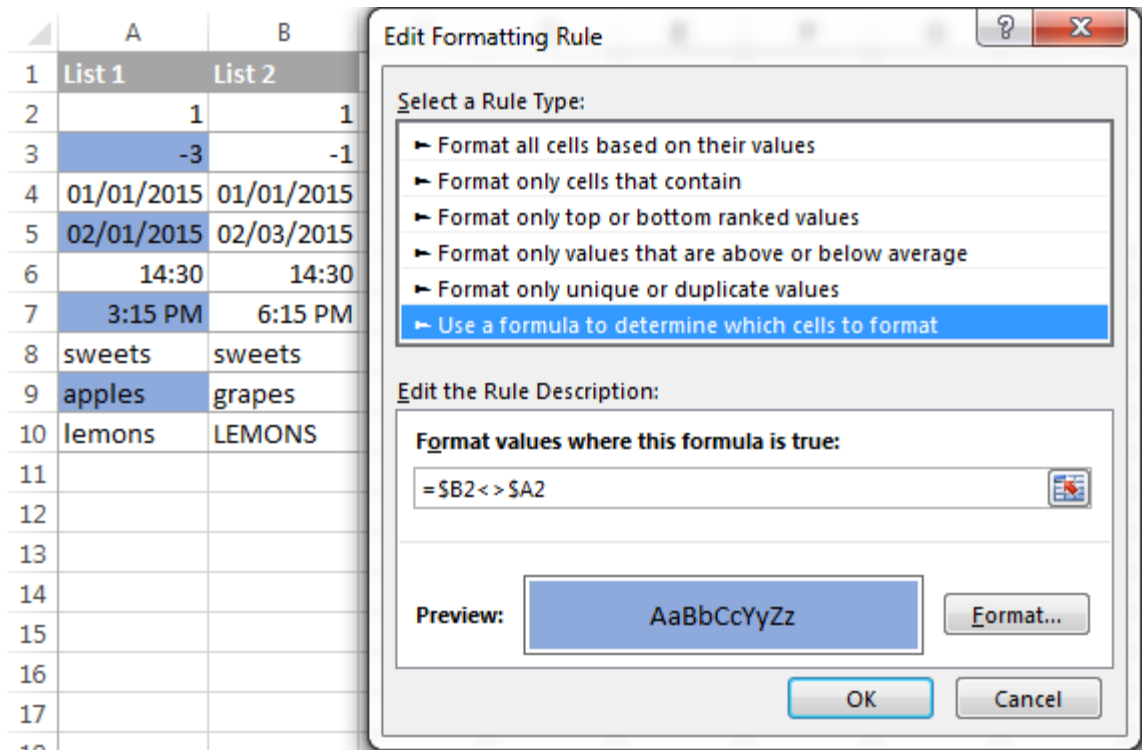

Example 1. Highlight matches and differences in each row

To compare two columns and Excel and highlight cells in column A that have **identical entries** in column B in the same row, do the following:

- Select the cells you want to highlight (you can select cells within one column or in several columns if you want to highlight entire rows).
- Click *Conditional formatting > New Rule... > Use a formula to determine which cells to format*.
- Create a rule with a simple formula like `=B2=A2` (assuming that row 2 is the first row with data, not including the column header). Please double check that you use a relative row reference (without the \$ sign) like in the formula above.

To highlight differences between column A and B, create a rule with the formula `=B2<>A2`

If you are new to Excel conditional formatting, please see [How to create a formula-based conditional formatting rule](#) for step-by-step instructions.

Example 2. Highlight unique entries in each list

Whenever you are comparing two lists in Excel, there are 3 item types that you can highlight:

- Items that are only in the 1st list (unique)
- Items that are only in the 2nd list (unique)
- Items that are in both lists (duplicates) - demonstrated in the [next example](#).

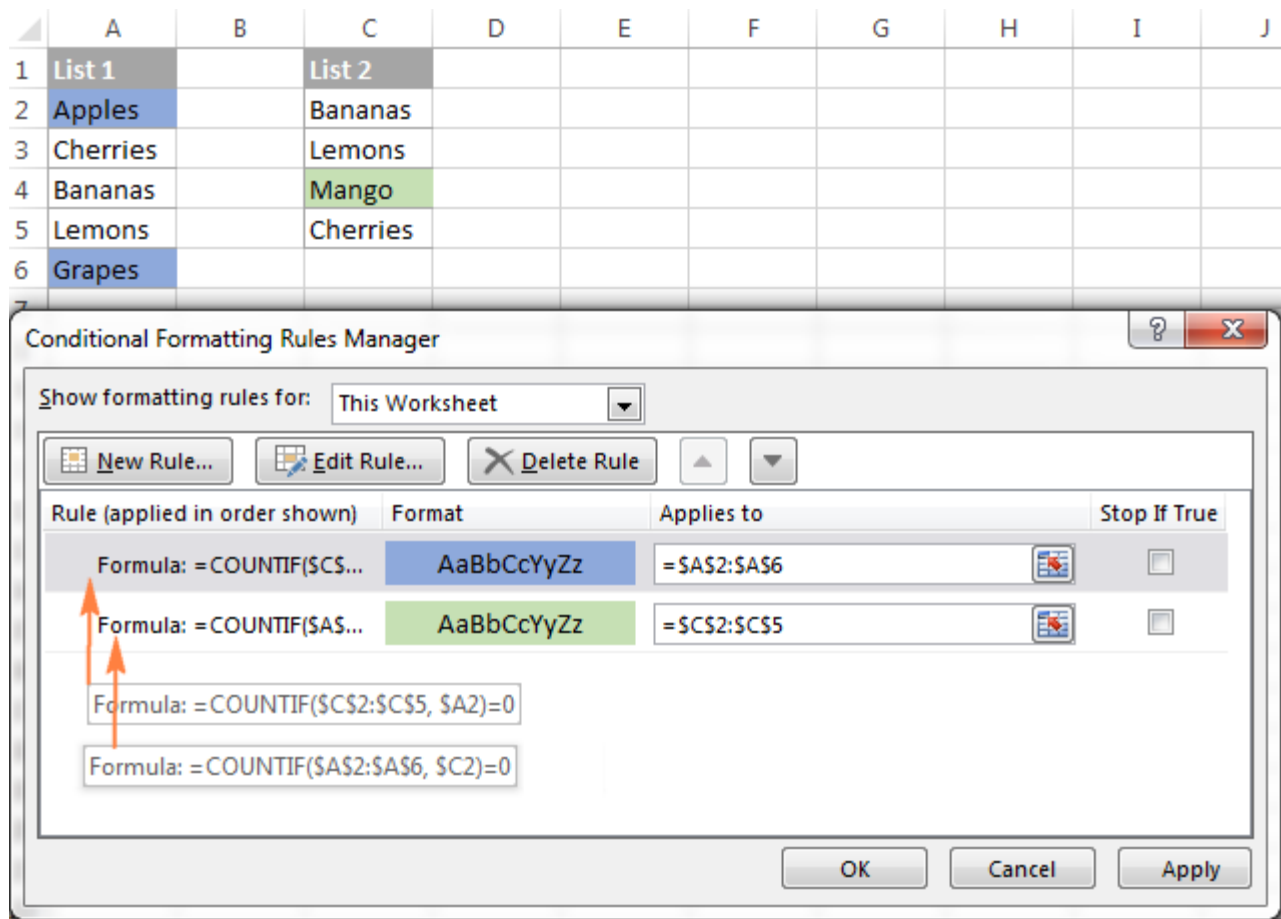

This example demonstrates how to highlight items that are in one list only.

Supposing your List 1 is in column A (A2:A6) and List 2 in column C (C2:C5). You create the conditional formatting rules with the following formulas:

Highlight unique values in List 1 (column A): =COUNTIF(\$C\$2 : \$C\$5 , \$A2)=0

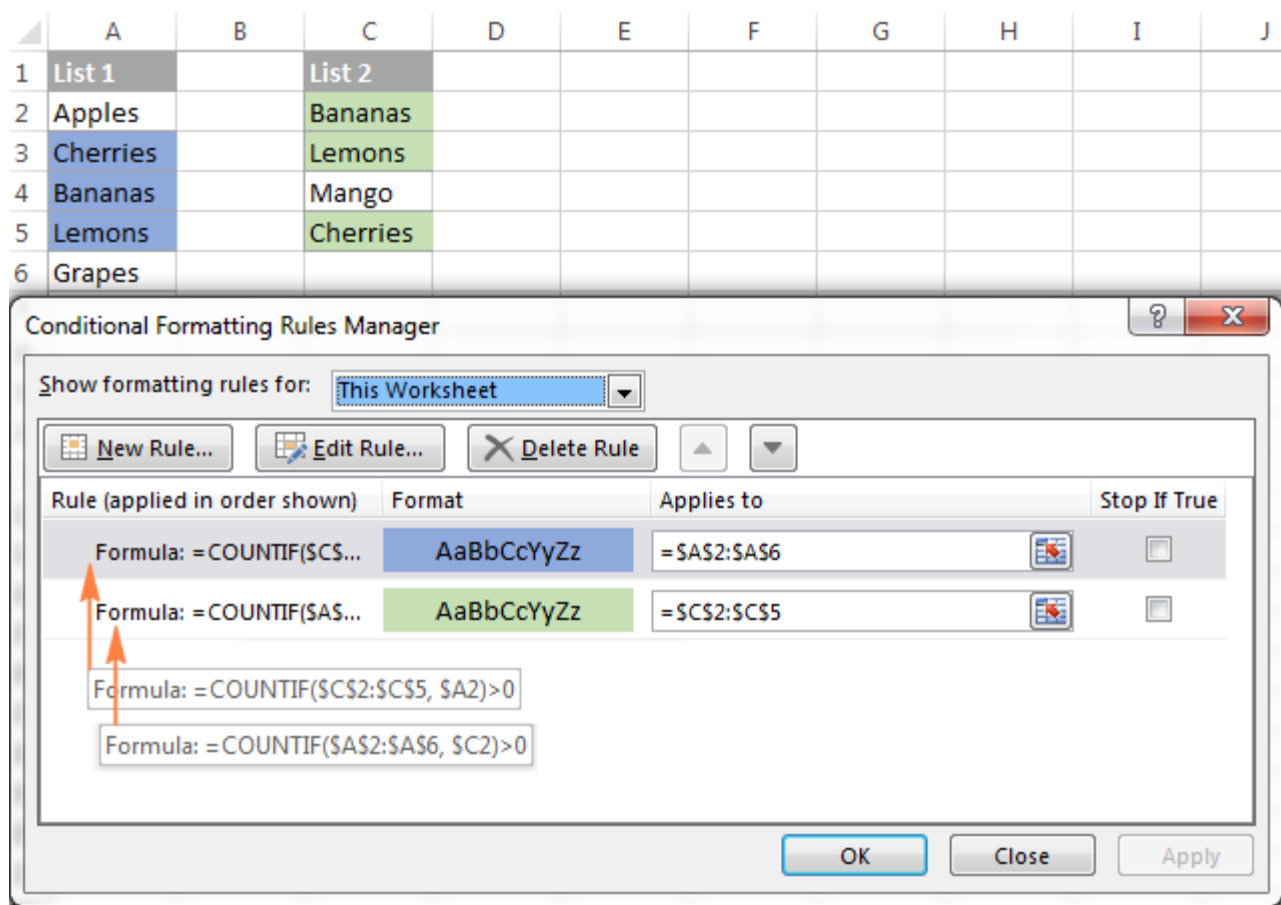

Highlight unique values in List 2 (column C): =COUNTIF(\$A\$2 : \$A\$6 , \$C2)=0

And get the following result:

Example 3. Highlight matches (duplicates) between 2 columns

If you closely followed the [previous example](#), you won't have difficulties adjusting the COUNTIF formulas so that they find the matches rather than differences. All you have to do is to set the count greater than zero:

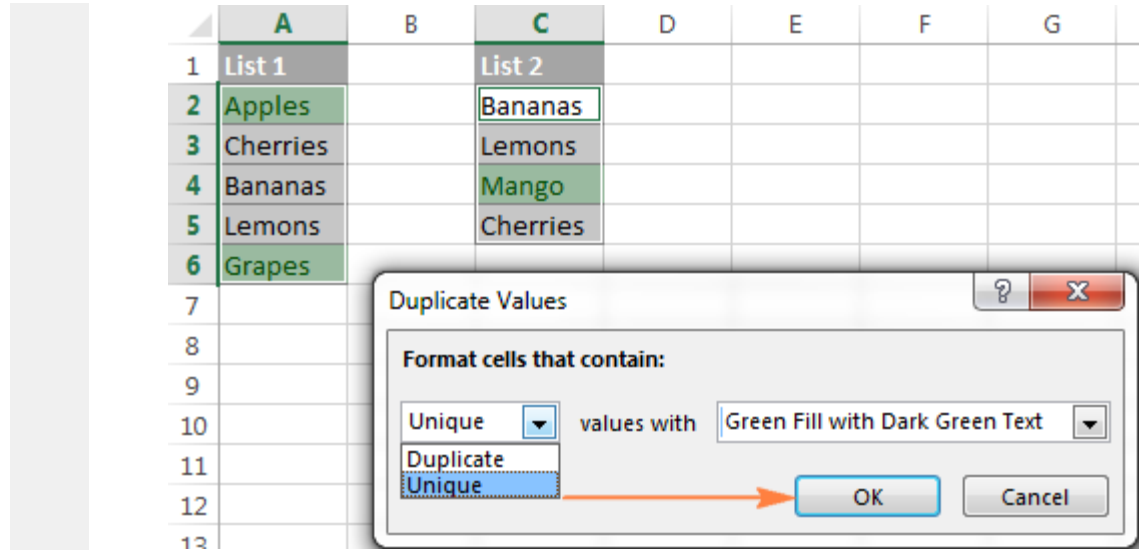

Highlight matches in List 1 (column A): `=COUNTIF(C2:C5, $A2)>0`

Highlight matches in List 2 (column C): `=COUNTIF(A2:A6, $C2)>0`

Example 4. Built-in rule to compare 2 lists and highlight duplicates or uniques

If you are one of those power users who mostly rely on functions and formulas, you may have missed this amazingly simple way to compare two columns in Excel :)

- Select two lists you want to compare. If they include different numbers of cells or are located in non-adjacent columns, select the first list, press and hold the **Ctrl** key, and then select the second list.
- On the *Home* tab, go to *Conditional Formatting > Highlight Cells Rules > Duplicate Values*.
- Select either **Duplicate** or **Unique** from the left-hand side drop-down list, and choose the desired format from the right-hand side drop-down. If you are not happy with any of the predefined formats, click *Custom format...* and set the Font or Fill color to your liking.
- Click *OK* and you are done!

Highlight row differences and matches in multiple columns

When comparing values in several columns row-by-row, the quickest way to highlight matches is creating a conditional formatting rule, and the fastest way to shade differences is embracing the *Go To Special* feature, as demonstrated in the following examples.

Example 1. Compare multiple columns and highlight row matches

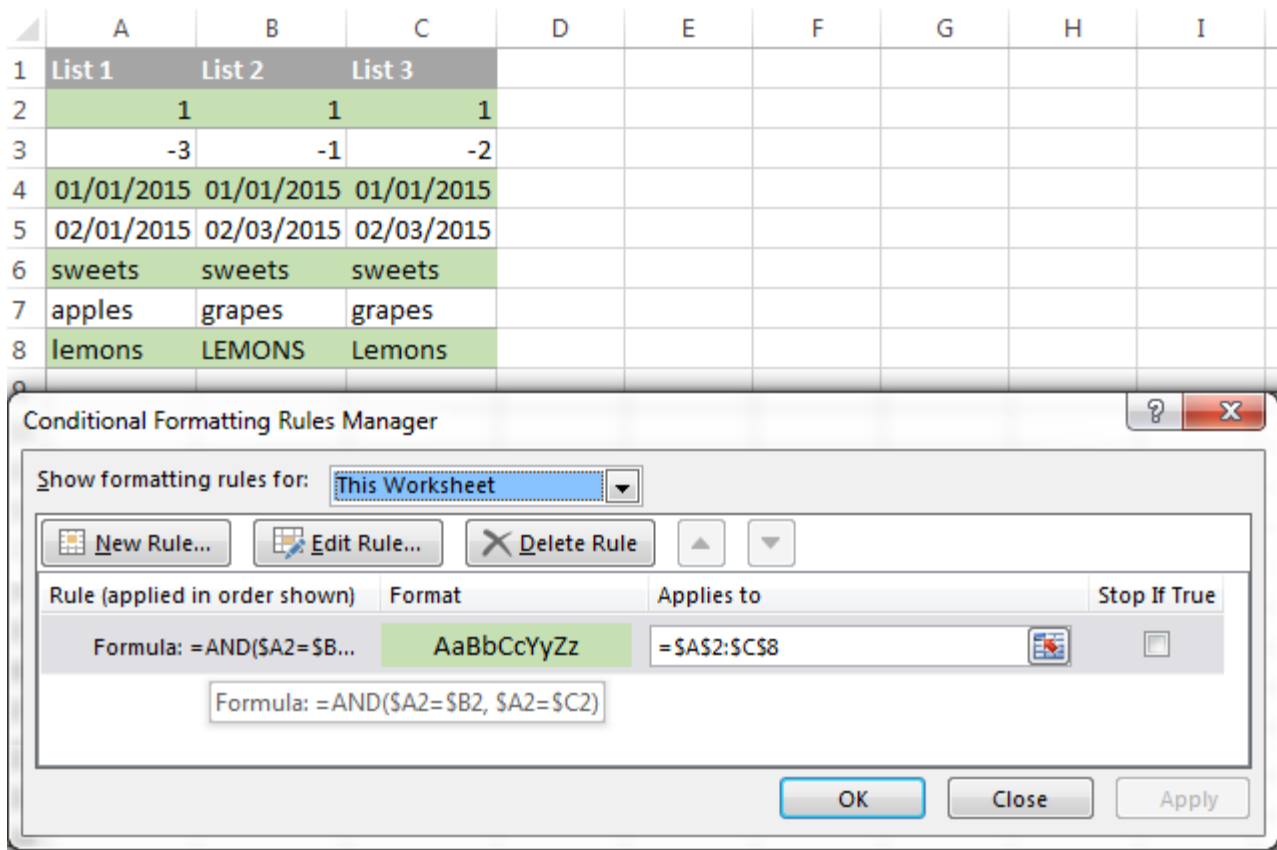

To highlight rows that have **identical values in all columns**, create a conditional formatting rule based on one of the following formulas:

`=AND($A2=$B2, $A2=$C2)`

or

`=COUNTIF($A2:$C2, $A2)=3`

Where A2, B2 and C2 are the top-most cells and 3 is the number of columns to compare.

Of course, neither AND nor COUNTIF formula is limited to comparing only 3 columns, you can use similar formulas to highlight rows with the same values in 4, 5, 6 or more columns.

Example 2. Compare multiple columns and highlight row differences

To quickly highlight cells with different values in each individual row, you can use Excel's **Go To Special** feature.

- 1. Select the range of cells you want to compare. In this example, I've selected cells A2 to C8.

	A	B	C
1	List 1	List 2	List 3
2	1	2	3
3	-3	-1	-3
4	01/01/2015	01/01/2015	01/02/2015
5	02/01/2015	02/02/2015	02/03/2015
6	sweets	pies	cakes
7	apples	grapes	oranges
8	apples	LEMONS	Lemons

By default, the top-most cell of the selected range is the active cell, and the cells from the other selected columns in the same row will be compared to that cell. As you can see in the screenshot above, the active cell is white while all other cells of the selected range are highlighted. In this example, the active cell is A2, so the **comparison column** is column A.

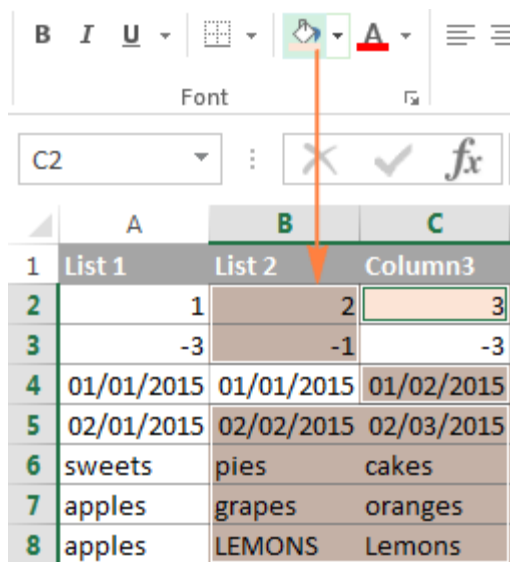

To **change the comparison column**, use either the Tab key to navigate through selected cells from left to right, or the Enter key to move from top to bottom.

Tip. To select **non-adjacent columns**, select the first column, press and hold **Ctrl**, and then select the other columns. The active cell will be in the last column (or in the last block of adjacent columns). To change the comparison column, use the Tab or Enter key as described above.

2. On the *Home* tab, go to *Editing* group, and click *Find & Select > Go To Special...* Then select **Row differences** and click the *OK* button.

3. The cells whose values are different from the comparison cell in each row are highlighted. If you want to shade the highlighted cells in some color, simply click the *Fill Color* icon on the ribbon and select the color of your choosing.

How to compare two cells in Excel

In fact, comparing 2 cells is a particular case of [comparing two columns in Excel row-by-row](#) except that you don't have to copy the formulas down to other cells in the column.

For example, to compare cells A1 and C1, you can use the following formulas:

For matches: `=IF(A1=C1, "Match", "")`

For differences: `=IF(A1<>C1, "Difference", "")`

To learn a few other ways to compare cells in Excel, please see [How to compare strings in Excel](#).

For more powerful data analysis, you may need more sophisticated formulas and you can find a few good ideas in the following tutorials:

- [Using IF function in Excel](#)
- [Nested IF with multiple conditions, IFERROR, IFNA and more](#)

Formula-free way to compare two columns / lists in Excel

Now that you know Excel offerings for comparing and matching columns, let me demonstrate you an alternative solution that can compare 2 lists with a different number of columns for matches (duplicates) and differences (unique values).

[Ablebits Duplicate Remover for Excel](#) can search for identical and unique entries within one table as well as compare two tables residing on the same sheet or in 2 different worksheets / workbooks.

For the purpose of this article, we will be focusing on the second feature, which is called **Compare Two**

Tables and is specially designed for comparing two lists by any column(s) that you specify. The comparison of two data sets **by several columns** is a real challenge both for Excel formulas and conditional formatting, but this tool handles it with ease.

Compare 2 lists by several columns in 6 quick steps

Supposing you have 2 tables of data and you want to find duplicate rows based on 3 columns - *Date*, *Item* and *Sales*:

Date	Salesman	Item	Sales
1-Jul-12	Pieter	Apples	\$20
2-Jul-12	Rob	Oranges	\$30
10-Jul-12	Neal	Grapes	\$40
4-Jul-12	Rob	Cherries	\$25
8-Jul-12	Neal	Apples	\$60
12-Jul-12	Pieter	Cherries	\$35
7-Jul-12	Neal	Apples	\$15

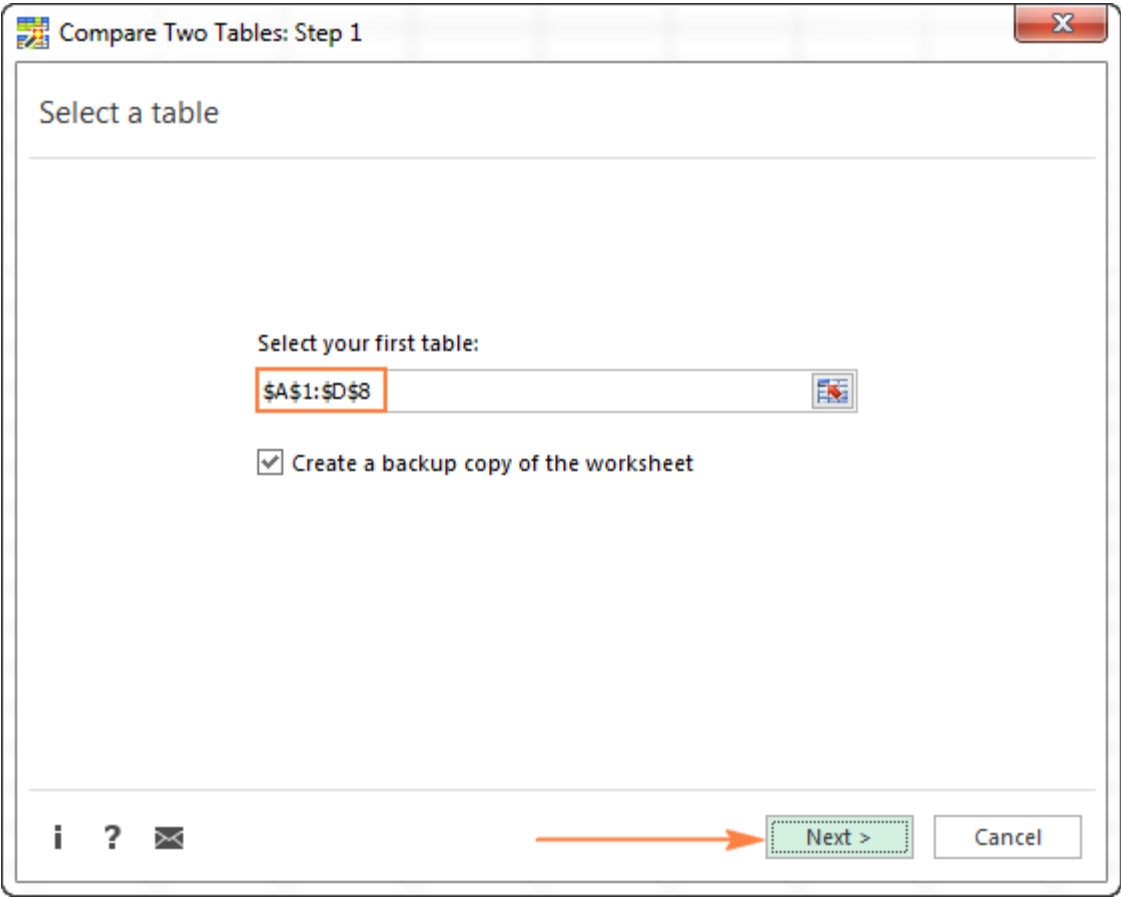

Date	Item	Sales
4-Jul-12	Apples	\$25
10-Jul-12	Grapes	\$45
2-Jul-12	Oranges	\$30
4-Jul-12	Cherries	\$40
7-Jul-12	Apples	\$15
7-Jul-12	Grapes	\$35

Columns to compare

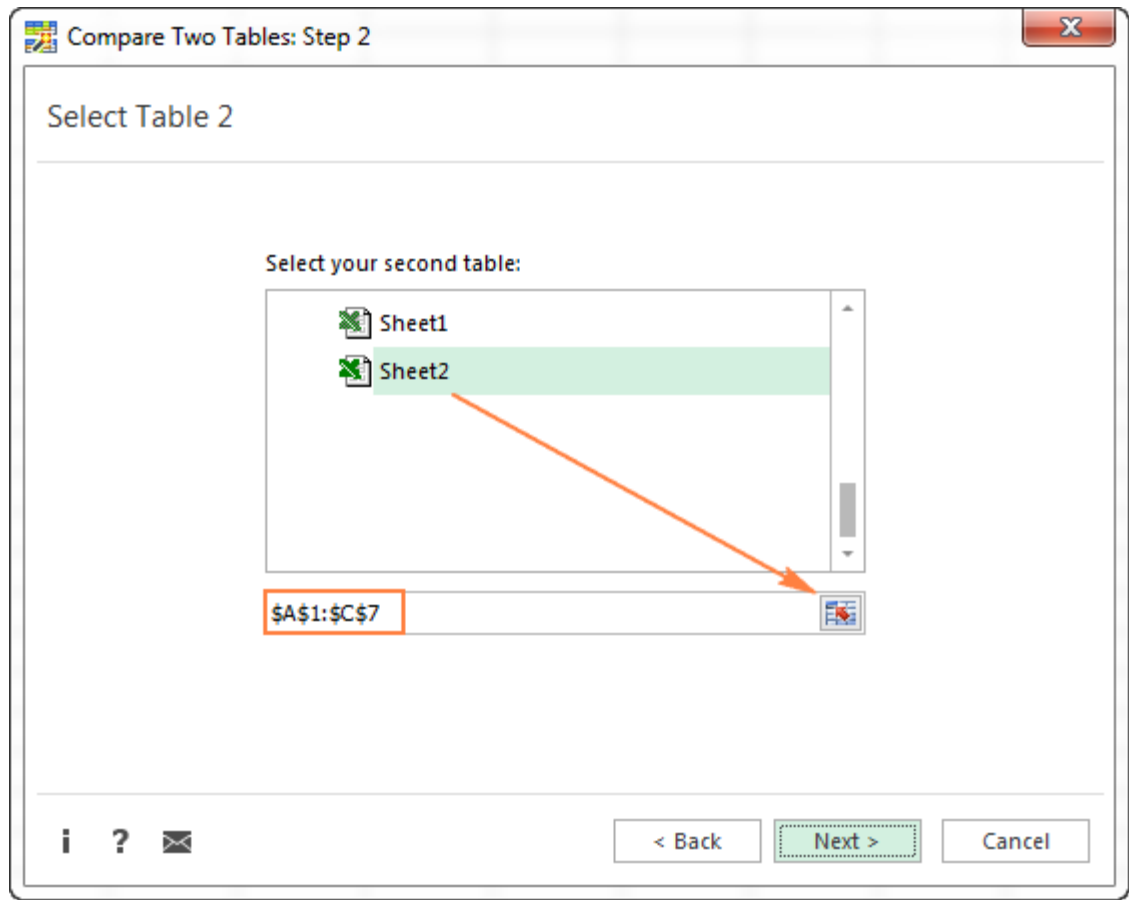

Step 1. Assuming that you have the Duplicate Remover for Excel installed, select any cell within the 1st table, and click the **Compare Two Tables** button on the ribbon to start the wizard. This button resides on the *Ablebits Data* tab, in the *Dedupe* group.

Step 2. The wizard picks the entire table and suggests to create a backup copy of the original table, just in case. So, simply make sure your 1st table is selected correctly and click *Next*.

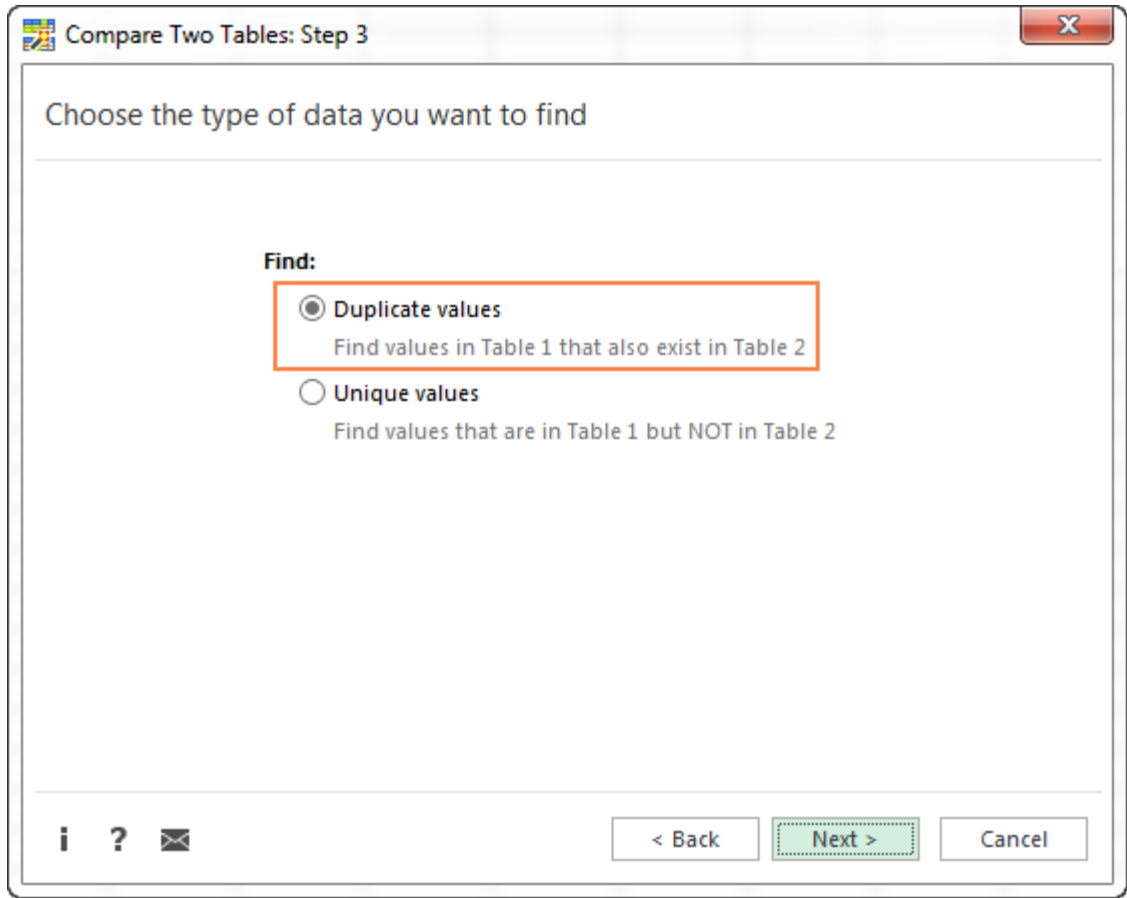

Step 3. Select the 2nd table by using the standard *Select range* icon . If both tables reside in the same workbook and have similar column names, there's a great chance that the second list will be fetched automatically as well.

Step 4. Select whether to search for matches or differences:

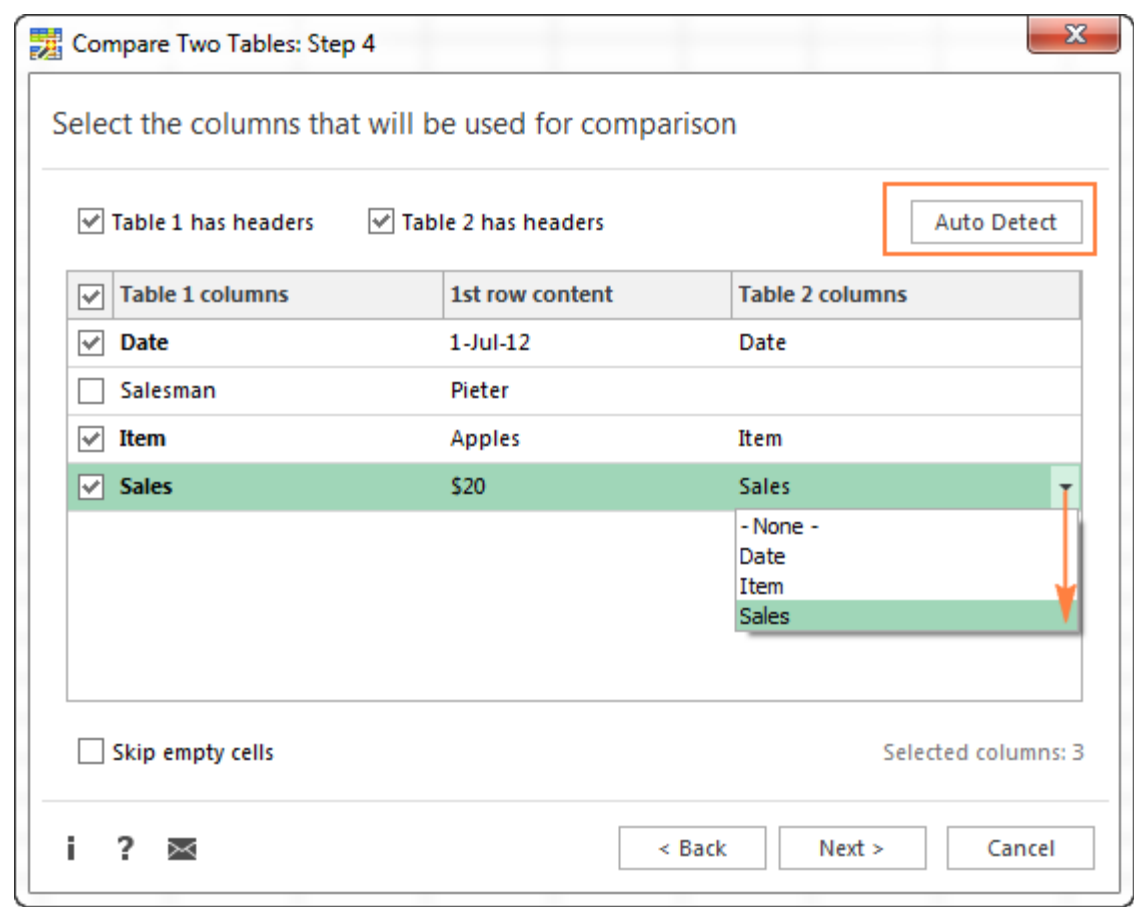

- Duplicate values - look for matches, i.e. items that exist in both tables.
- Unique values - look for differences, i.e. items that are in Table 1 but not in Table 2.

In this example, we select **Duplicate values** and click *Next*.

Step 5. This is the key step where you **select the column pairs** you want to compare in 2 tables. In this example, we are comparing 3 columns - *Date*, *Item* and *Sales*.

For the wizard to find the matching columns automatically, click the *Auto Detect* button in the upper-right corner. If the columns have different names in both tables, you might need to select the right column manually by clicking the little black arrow next to the Table 2 column on the right-hand side:

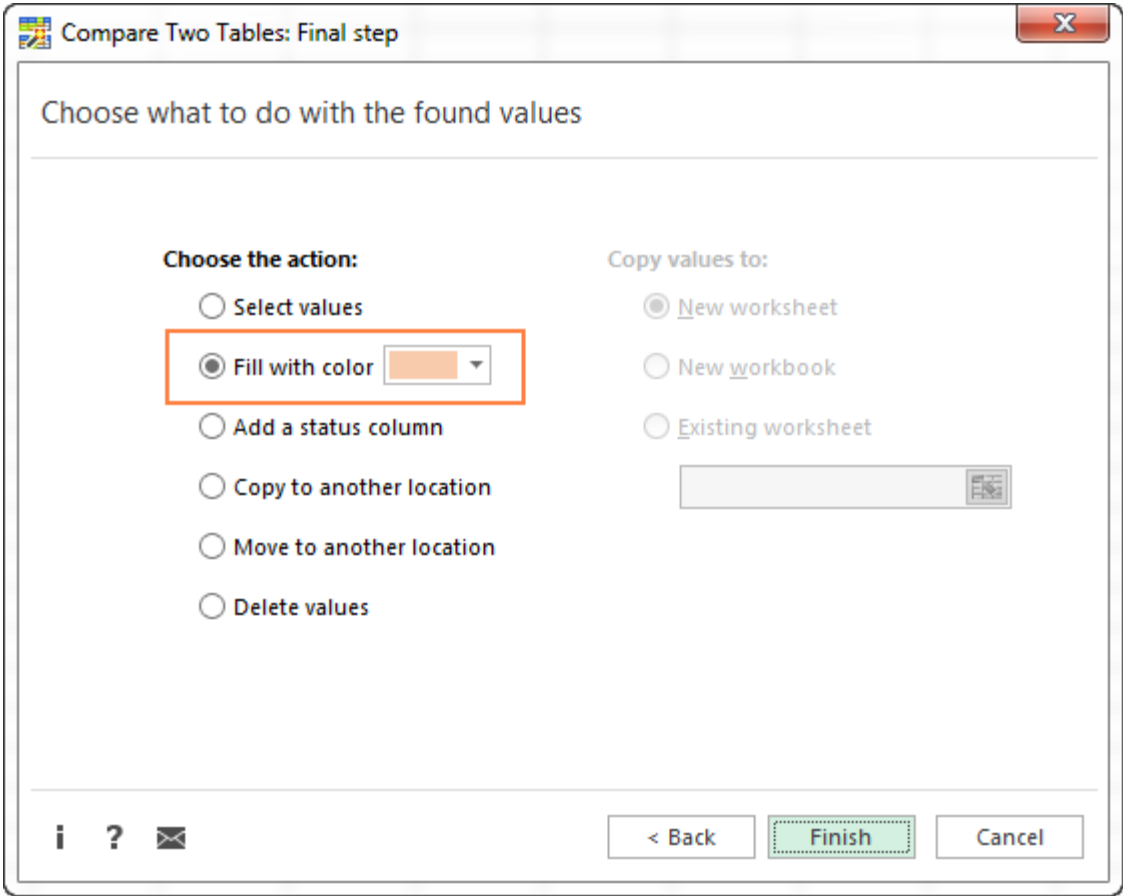

Step 6. In the final step, you choose how to deal with the found items and click *Finish*.

The following two options deliver the results comparable to Excel formulas and conditional formatting that we've discussed earlier in this tutorial:

- **Add a status column** - adds a new column with "Duplicate" or "Unique", like Excel IF formulas do.
- **Highlight** - shades duplicate or unique rows like an Excel conditional formatting rule.

In addition, you can choose to **delete** the duplicate entries, **move** or **copy** to another worksheet, or just **select** the found items.

In this example, I've decided to highlight duplicates in the following color:

And got the following result in a moment:

Date	Salesman	Item	Sales
1-Jul-12	Pieter	Apples	\$20
2-Jul-12	Rob	Oranges	\$30
10-Jul-12	Neal	Grapes	\$40
4-Jul-12	Rob	Cherries	\$25
8-Jul-12	Neal	Apples	\$60
12-Jul-12	Pieter	Cherries	\$35
7-Jul-12	Neal	Apples	\$15

Date	Item	Sales
4-Jul-12	Apples	\$25
10-Jul-12	Grapes	\$45
2-Jul-12	Oranges	\$30
4-Jul-12	Cherries	\$40
7-Jul-12	Apples	\$15
7-Jul-12	Grapes	\$35

Duplicate Remover for Microsoft Excel

2 duplicate values have been found and colored.

OK

If we chose *Add a status column* in the previous step, the result would look as follows:

Table 1					
	Date	Salesman	Item	Sales	Duplicate Remover marks
3	1-Jul-12	Pieter	Apples	\$20	
4	2-Jul-12	Rob	Oranges	\$30	Duplicate
5	10-Jul-12	Neal	Grapes	\$40	
6	4-Jul-12	Rob	Cherries	\$25	
7	8-Jul-12	Neal	Apples	\$60	
8	12-Jul-12	Pieter	Cherries	\$35	
9	7-Jul-12	Neal	Apples	\$15	Duplicate

Duplicate Remover for Microsoft Excel

 2 duplicate values have been found and marked in a status column.

OK

This is how you compare and match columns in Excel. If you are interested to try this tool, you are welcome to [download](#) a fully functional trial version. And if you like it, we will happily offer you the 15% off coupon code that we've created especially for our blog readers: **AB14-BlogSpo** . It works both for the [Duplicate Remover tool](#) purchased as a separate product and as part of [Ultimate Suite for Excel](#).

If you want to have a closer look at the formulas discussed in this tutorial, feel free to download the [Compare Excel Lists workbook](#). Thank you for reading and see you next week!

As a step in a bank reconciliation, I am comparing two list of \$amt. I do have a unique identifier in one list but not the other, just \$ values.

I want to compare the \$values and find a "unique" match. Meaning, say I have \$155 twice in list 1, three times in list 2.
Is there a way to id the match 2?
With a unique identifier in both list, two column match with condition formatting would work fine.
It a large volume of data, please help!

I need help writing a formula to find matches between a column in SHEET1 and a column in SHEET2. Goal is to get "Match" inserted into Column B, SHEET1 if there is a match between Column A and Column B.

I tried:
`=IF(A2=$SHEET2$,B2,"Match",")` but this didn't work. Can someone help me out please!

Data:

Column A, SHEET1
12AB1250
12AB1251
12AB1252

Column A, SHEET2
12AB1250
12AB1251
12AB1252
12AB1253
12AB1254
12AB1255

Thanks in advance!

Good day
I`m a marine engineer.I am just creating a worksheet where if a parameter in column F is greater than a parameter in columnn I by 0.03(P4>Pd>0.03),A separate column say H has to highlight each row as Abnormal with cell bgrnd as red.Would you please help me on this
Thanks in advance
Allan

how to Compare table columns in excel
for example
Table -1
Col A; Col B; Col C;
Roll No. Std. Name Result 1 semester (total Marks)
1 A 50
2 B 40
3 C 55

Table -2
Col A; Col B; Col C;
Roll No. Std. Name Result 2 semester (total Marks)
2 B 45
4 D 60
1 A 60
3 C 50

I Want to Result like that

Table -1 Table-2
Col A; Col B; Col C; Col D; Col E; Col F;
Roll No. Std. Name Result S-1 Roll No. Std. Name Result S-2
1 A 50 1 A 60
2 B 40 2 B 45
3 C 55 3 C 50
4 D 60

Could you described please how i could solve this as Table 2 match with table 1 and sort and place the record on same row
thanks

Hi, kindly help me derive a proper formula for this problem. I am using two sheets Sheet 1 & Sheet 2 in excel 2013. I created a drop down value (1-15 & 1-15) in the first sheet using data validation to derive two numbers in two different cells. In the second sheet I have created variables (with 1-15 in one cell and 1-15 in another cell) to derive a result in the third column). Say, in the first sheet I have one column no. of factories (1-15) & No of Managers (1-15). In the second sheet I have created the variable; No. of Factories, No of Manager & in the third row their Operating hours:

No of Factories: 1/2/3/4/5/....
No of Managers: 1/2/3/4/5/....
No of Operating hours: 8 (in case 1,1), 15 (1, 2), etc.

Now in the first sheet I want to use the drop down values to enter what i want to know and get the result using a formula.

Kindly help me with this.

Hello I have 10 values in Col A and 3 values in Col B. I want to highlight only values that match col A with Col B and mark others in a diff color . How do i do it?

Col A Col B

1 1
2 6
3 9
4
5
6
7
8
9
10

Col A Col B

1 1 Match

Hi,

I have an sheet with columns from January to December where people make contributions on monthly basis. A person's contribution is the same through out the year.

I would want a formula that shows if someone is contributing the same figure throughout the year or not, kind of like "True" and "False" formula but it should be checking in all the columns thus January-December and not just two columns whose formula I know is =A2=B2

Thanks.

HELP!

Would you please help me?

It is really important.

What i want to do is this

compare columns for any two or more cells with the same values within the same row and highlight individual rows after matching

I have 20 different columns that i need to compare for any two or more duplicate cells among them

How can i do that with the simplest way?

Thank you

Hello, Kostis,

Please try Duplicate Remover for Excel:

<https://www.ablebits.com/excel-remove-duplicates/index.php>

You can run it on pairs of columns several times. Select the first column as master table and the second as your lookup table. You can email a sample table with your data in Excel to support@ablebits.com for more detailed instructions.

Hi, I need to copy data from one cell to another on daily basis

Example,

A1 : =TODAY() //Changes Daily

B1 : =SUM(B2:B10) //Changes Daily

I need the B1 value to be copied on C1

Next day B1 value to be copied on C2

Next day B1 value to be copied on C3 and so on...

Waiting for your support

Thanks in advance

I need some help.

I am using vlookup to draw information from sheets A and B and then compare them side by side on Sheet C. The values happen to be in time format. I need to have a formula (or a quick system) to highlight the the cells so that I can quickly spot the different in the times and then correct them. The spreadsheet that I am using is already full of useful conditional formatting and so would really like it to just appear a different colour so that it gets my attention.

Any suggestions much appreciated

I am facing an issue of 10,000 row items contains data for visits.

data contains same name but different start date and end date

Shop Name Opening End

CRUSH TRUCKING STATION 12-May-11 22-Dec-14
SUPERIOR II FILLING STATION 11-Dec-13 14-Mar-14
INDUS FILLING STATION 13-Dec-13 21-Feb-14
INDUS FILLING STATION 21-Feb-14 17-Oct-14
SUPERIOR II FILLING STATION 14-Mar-14 23-Oct-14
INDUS FILLING STATION 17-Oct-14 25-Jan-15
SUPERIOR II FILLING STATION 23-Oct-14 16-Jan-15
SUPERIOR II FILLING STATION 16-Jan-15 08-May-15

Is there any solution for above to adjust columns in start and end date in same shop name

Hi
I need to make filter for unique value that created by multi user once per month per user than we need to calculate the QTY of the unique number per user

Example for my Question:

transaction_date	Value	User_NAME
1/1/2017	1222889205	Mark
2/1/2017	1222889205	Mac
4/1/2017	1254879863	Eva
21/2/2017	1225478962	Jake
4/5/2017	1254879863	Eva
5/5/2017	1254879863	Eva
1/6/2017	1254793658	Mac
1/6/2017	1254793658	Jake
6/6/2017	1254793658	Eva

****my Solution**

Month	user	Count for unqiue value
jan	Mark	1
	Mac	1
	Eva	1

Feb JaKe 1

May Eva 1

Jun Mac 1
JaKe 1
Eva 1

Appreciate your support thanks

Hi,

Hopefully someone can understand what I am trying to do here.

I am currently going through some spreadsheet files and I would like to find case based non-duplicates e.g.

Column A Column B
Row 1 Harry Potter Ron Weasley
Row 2 harry potter Ron Weasley

Basically I am looking for true non-duplicates where the case of the text is concerned, the above example using the method I am currently using (Conditional formatting and Highlight duplicate values) will mark the above A1&A2 example as a duplicate even though the case being different, I would like a solution to mark the A1&A2 entry as a non duplicate by any visual method to differentiate from an actual true duplicate entry e.g. B1&B2, note I do not want to manipulate the data to become true duplicates just want to highlight the case differences.I'm cross examining two Rows with about 40-50 Columns, in a multitude of files.

Is what I am trying to achieve possible?

Any and all help will be appreciated.

Kind Regards
Jack

Hello, I have been trying pull some matching data with little luck. I have 2 data sets 1 with demographic information and one with home sales information. Both have addresses I have broken down by: home number, direction,street name. These data sets are on 2 different sheets. How do I find matching: home number, direction, street name on each sheet? Hopefully that makes sense.

I have a spreadsheet with over 100000 service name entries, however the service name can be named slightly different on several rows. I want to know if there is a formula which can highlight

any mis matches in column B And C. For example the service is APERTURE but I can be known as APERTURE-CONT or APERTURE-UAT, however the owners name is different. I don't fancy going through all 10000 lines so was hoping there may be a formula that can highlight this

SERVICE	Owner First Name	Owner Last Name
APERTURE	JOE	BLOGGS
APERTURE-CONT	JOE	BLOGGS
APERTURE-UAT	DERREN	YOUNG

Need help,
I'd like to be able to compare two cells with unique strings
Ex. A1 = xyz0_ok_hmu1-ty
B1 = ok1_ty
I want it to be able to recognize that it is similar to a minimum of 2 ordered letter matches and be highlighted as "similar". If it is able to ignore multiple delimiters, that would be cool too.

Reply

Earl says:

March 17, 2017 at 7:21 pm

btw, the strings are a bunch of acronyms that doesn't make sense, and people have their own way of writing it therefore there are a lot of differences and minimal similarities.

Reply

Natalia Sharashova (Ablebits.com Team) says:

April 21, 2017 at 2:57 pm

Hello, Earl,

I'm afraid that existing Excel functions won't help since the comparisons are too vague, if I may say so. We can only advise you to try and use [Fuzzy Lookup Add-In for Excel](#) from Microsoft.

I'm trying to pull information from one spreadsheet into another, where the combination of two cells of data in each spreadsheet match exactly.

Each spreadsheet contains two columns that contain the exact same data:

- Spd 1 - Column D> Work Order
- Spd 1 - Column M> Contract Unit Name
- Spd 2 - Column I> Work Order
- Spd 2 - Column Q> Contract Unit Name
- Spd 2 - Col V Invoiced Amt

So where Spd 1, Col D and Col M = Spd Col I and Col Q, Import the value in Col V into Spd 1 Col O (Invoiced Amt)

Data sample:

- Spd 1:
- | Work Order | Contract Unit Name |
|---------------|------------------------------|
| E.724292.C.03 | NRE-ROW AGENT BEA |
| E.724292.C.03 | NRE-ROW AGENT I |
| E.731518.C.17 | NRE-EXISTING RIGHTS LEVEL I |
| E.731518.C.17 | NRE-EXISTING RIGHTS LEVEL II |
| E.732518.C.17 | NRE-PROJECT COORDINATOR |
| E.732518.C.17 | NRE-TITLE SEARCH I |

- Spd 2:
- | Work Order | Contract Unit Name | Invoiced Amt. |
|---------------|------------------------------|---------------|
| E.724292.C.03 | NRE-ROW AGENT BEA | 100.00 |
| E.724292.C.03 | NRE-ROW AGENT I | 75.00 |
| E.731518.C.17 | NRE-EXISTING RIGHTS LEVEL I | 125.00 |
| E.731518.C.17 | NRE-EXISTING RIGHTS LEVEL II | 175.00 |
| E.732518.C.17 | NRE-PROJECT COORDINATOR | 95.00 |
| E.732518.C.17 | NRE-TITLE SEARCH I | 200.00 |

Do I use MATCH and INDEX and what would my formula look like?

Hello There, i am kind of stuck with manipulating the excel worksheets.

Scenario : Compare the cell text in two excel and replace range of value in sheet two with Values in Sheet one. Any guess how can we achieve this ?

Scenario : Wanted to Pull the Values from Sheet one With all the Cells containing abc*(text)in sheet 1 and Copy the same Text and adjacent 3 Values from each row.

Sheet 1 :

row/col Col1 col2 col3 col4
row1 123 abcde ghk 143

Sheet 2 :

row /col Col1

The spread sheet contain two column. In first column there is only the level i.e., Block, GP and Village and in another there is name contain of the respective Block, GP and Village. Let me know how I can manage the sheet that looks like in this manner as follows

Block GP Village
Block Name GP Name Village Name
(if there is 10 village then it is shown in row wise)
GP Name Village Name

Your page is excellent; your team is very helpful. I'm struggling with an issue. I have one sheet where I would like to highlight only the rows where values duplicated in the first column where the there are differing values in the second column. Duplicates are allowed in the first column. Duplicate values are allowed in the second column, also. However, duplicated values in the first column should always be paired with the same value in the second column. If not, then highlight all rows where first column contains the same duplicated value.

Thank you.

Col-A Col-B Format
1 C Highlight Row
1 C Highlight Row
1 D Highlight Row
2 A No Highlight
2 A No Highlight
3 E No Highlight
4 C No Highlight
5 A Highlight Row
5 F Highlight Row

Hi,

Below is a sample of the data I have. I want to match the data in Column A and B. If column B is not matching column A, I want to add a row and copy the data from Column A to B. For example, "4" is missing in column B, so I want to add a space and add "4" to column B so it will match column A. I have a large set of data, so I am trying to find a different way instead of checking for duplicate values in the two columns and manually adding one row at a time. Thanks!

A B C D

3 3 Y B
4 5 G B
5 6 B G
6 8 P G
7 9 Y P
8 11 G Y
9 12 B Y

Hi,

I need to compare two columns that should be the same, but the data in each comes from different sources.

Both columns are dd/mm/yyyy hh:mm format.

My issue is that in one column, there's an extra " " between the date and time, and when I run my comparison =AND formula, the extra space is causing it to fail.

Can you suggest a way I can easily remove the extra space, or get Excel to ignore the extra space?

I need a formula that will help me identify duplicate parts/product at different pricing. When I use the conditional formatting on both columns all of the cells are highlighted because it's looking at just the columns as duplicates.

Reply

Natalia Sharashova (Ablebits.com Team) says:

July 10, 2017 at 10:30 am

Hi, Eva,

I managed to do that in the following way:

1) I decided to use a helper column (C) that checks if the product (A1) is duplicated and its price (B1) is unique with the following formula:

=COUNTIFS(A:A,\$A2,B:B,"<>"&B2)

If the condition is true the formula returns 0, since it can't find any duplicated products with unique prices. Otherwise, it returns 1.

2) I created a following conditional formatting rule:

=C1>=1

and applied it to my table =\$A:\$C

As a result, I can see all the duplicate products with unique prices highlighted in yellow.

Try to do the same with your data, hope it helps!

Salaam everyone.

I have two excel columns each containing 63,000 values. I want to find out all the values where entries of column A are greater than those of column B. How can I do that?

Thanks in advance

Stay blessed.

Reply

Svetlana Cheusheva says:

July 19, 2017 at 3:58 pm

Hello Fiaz,

You can enter the following formula in the first cell with data, say A1:

=IF(A1>B1, TRUE, "")

Then, [copy the formula to the entire column](#). And after that sort or filter your dataset by the formula column.

hi, i need a formula to detect the values of the weight in a column and if it is more than the value then to add 7.50 but if it is less then the value to add 4.
so for example if the products weigh less than 0.4 then i need the cell to add 4 but if they weigh more than to add 7.5

Compare to worksheets Sheet2 to Sheet1, find sheet2 match and then return data sheet1 from in 1st cell of this matched column.

2 work sheets

1st sheet contains A=data to return (1234) + B-H data to match 456,789,012

2nd sheet contains criteria to match - look for 456 then return A (1234)

Is there a way where we can identify

1. % similarity
2. between 2 columns
3. With strings as data.

Example:

Column A | Column B | Match

Cat is back | Dog is back | 33%

Superman | Spiderman | 0%

Hi
I want to compare Data in 2 columns A and B and want to highlight the different words only. Eg .

my A1 CELL contain Apple, Sweets, good
B1 cell contains
Apple, sweets, pizza, car

In above two cells in A1 good is extra word which is not present in CELL B1. Where as Cell B1 contains words " Pizza, car "which are not present in excel so how to highlight only these different words
I have lot of Data

Hi, Sandy,

I'm afraid there's no way to highlight only duplicate words in Excel. All the formulas and our add-ins will select or highlight the entire cell.
I can only advise you to ask around Mr.Excel forum in case they come up with some VBA code for you.
I wish I could assist you better.

Hi,

What I'm trying to do is highlight a row if there is any text found in cells in column E and column I.

So it would look something like:

IF text in Cell E
AND
Text in Cell I
Colour row red

There will always be text in the E column, so I only need the row to highlight if there is text found in the I column.

How do I go about doing this?

Thanks in advance :)

Hi,

How to lookup the value if the 2 cells having same value, excel is considering 1st cell but not considering 2nd cell (It should be considered)

Example all the 4 cells having the code of 7555 (Attachment below) here some of the row having different values and some of the column having different values

For me it should be added and required in another sheet

Code A B C

7555 395

7555 77 343

7555 158 262

7555 210

Hi,

I have set of lab values in one column & reference range in another column. I want to highlight the lab values which are "Out of Range" & "Within he Range". Please let me know; how to do that.

Hello,

For work I am tasked with downloading customer Forecasts and updating our backlog accordingly. it is a very time consuming process. there are multiple parts that are on multiple different purchase orders with quantities and dates varying on a monthly basis. the changes are not that frequent but I have hundreds of rows to go through. I am looking for a way to quickly find changes that have occurred month to month however I need to hold reference to the part number, purchase order, quantity and date. have you any thoughts on how I may be able to do this?

Hello, William,

if I understand your task correctly, we have the add-in that may help you.

Please take a look at the [Compare Two Tables](#) tool from the [Duplicate Remover](#) add-in. With its help you'll be able to find unique records or remove duplicate values between 2 worksheets.

You can download a fully functional trial version to test the add-in and see if it work for you from this web-page:

<https://www.ablebits.com/downloads/index.php>

Hope this'll help!

How to compare 2 columns to find the match exist or not. I need the formula which compares B1 with A:A. If Match found 1 else 0. I tried =IF(B:B=AA, 1,0) didn't work.

A B

0001165186 0094713197
0001166595 0097094894
0001166619 0094640211
0001190181 0097058341
0001196342 0016685760
0001213475 0016748842
0001216979 0016760276
0001217648 0097012553
0001222292 0097075931

Hello, Sarah,

Please try this formula:

=IF(ISNA(VLOOKUP(B1,\$A:\$A,1,FALSE)),0,1)

A2- U 4 8 WENDLAND STREET PORT LINCOLN SA 5606
A3- U 1 5 SCANLAN STREET EAST BRISBANE QLD 4169
A4- U 16 7 BERYL STREET WESTMEAD NSW 2145

B2- 4 8 WENDLAND STREET PORT LINCOLN SA 5606
B3- 8 HEIDELBERG STREET EAST BRISBANE QLD 4169
B4- 16 7 BERYL STREET WESTMEAD NSW 2145

When analyzing the differences in the above two data set. As you can see, A2 is similar to B2 (except for the letter U, which represents a Unit. For the purposes of my analysis, this is correct. As is A4 & B4). But clearly A3 is a different address to B3. How do i put a simple formulae in Except, which will extract the variations from two cells?

Thanks

Abs

i'm trying to track at what time of the day we have the biggest failure rate and highlight that time in the column. i have 5 columns, mon-fri. each column has rows broken into half hour increments. ex: row 4 is 8:30, row 5 is 9:00 etc. in the column in question, the value in row 4 is 10, row 5 is 19, row 6 is 27, row 7 is 31, row 8 is 60, and row 9 is 81. i can tell that the largest difference is between rows 7 & 8. is there a way to highlight row 8 to show that that is where the largest difference is? if so, how can i do it?

Thanks in advance.
